

Use global variables in CSS locator in script actions

Environment
<ul style="list-style-type: none">• Dynatrace Recorder

To use a global variable in a CSS locator to locate a dynamic element, add a Custom action to the script, before the action that contains the dynamic element.

Note the following requirements:

- Use the `control` window instead of `gomez_top[0]` to define the global variables.
- Do not use `var` in the variable definition.

See the attached sample script: [Example how to use global variables in CSS locator.gsl](#).
