

Does Dynatrace Synthetic Monitoring support testing for WebSockets

Environment

- Synthetic Classic

Question

Does Dynatrace Synthetic Monitoring support testing for WebSockets?

If yes, are there any specific settings or actions that we need to add/edit in the tests?

Sometimes we have a transaction that stops after a while, but then auto-refreshes itself, and the calls continue.

Is there a way to test this continuous flow of data, for a stipulated time for like 1-2 minutes, etc?

Answer

As of now, the Recorder only accepts URLs that start with http or https.

If you would like to test WebSockets in the transaction, please create a Request for Enhancement ticket for our Product Management group to consider it.
