

REST API 3.2 How to find the right name of the parameters and metrics

Question:

I am creating a REST request but cannot find which are the right names for the parameters and metrics I want to use.

Do you have such lists of all parameters and metrics or can you show me how I can find them?

Answer:

The Info request can give you those information with list set to dimensions for parameters and list set to metrics for metrics. Examples of call as below (*use your own user name and md5 hashed password*):

Metrics call for list of metrics:

https://ultraapi-prod.dynatrace.com/v3.2/synthetic/info?list=metrics&login=<user_login>&pass=<md5_hash_password>

Dimensions call for list of parameters:

https://ultraapi-prod.dynatrace.com/v3.2/synthetic/info?list=dimensions&login=<user_login>&pass=<md5_hash_password>

The pre-retrieved lists are also attached below for your convenience:

[Metrics.js](#)

[Dimensions.js](#)
