

Exclude the Recorder's URLs from a proxy

Environment:

- Dynatrace Recorder

The Dynatrace Recorder does not support specifying a proxy within a script. However, you can do this by adding the proxy parameters in the script's GSL file.

Save the script locally as a `.gsl` file, using the **Save** button or the **File > Save (local)** command. Then open the file into a text editor such as Windows Notepad

The parameters are:

```
<Param name="http://www.gomez.com/settings/proxy_script" value="pac script path" />
```

```
<Param name="http://www.gomez.com/settings/proxy_username" value="" />
```

```
<Param name="http://www.gomez.com/settings/proxy_password" value="" />
```

A related parameter is the *bypass parameter*. You can add this to a script when you don't want the script to use a local proxy to access the target pages. It is mainly used for Private Last Mile tests. The parameter is:

```
<Param name="http://www.gomez.com/capabilities/bypass_proxy" value="" />
```
